WALNUT CREEK WATERSHED ASSESSMENT

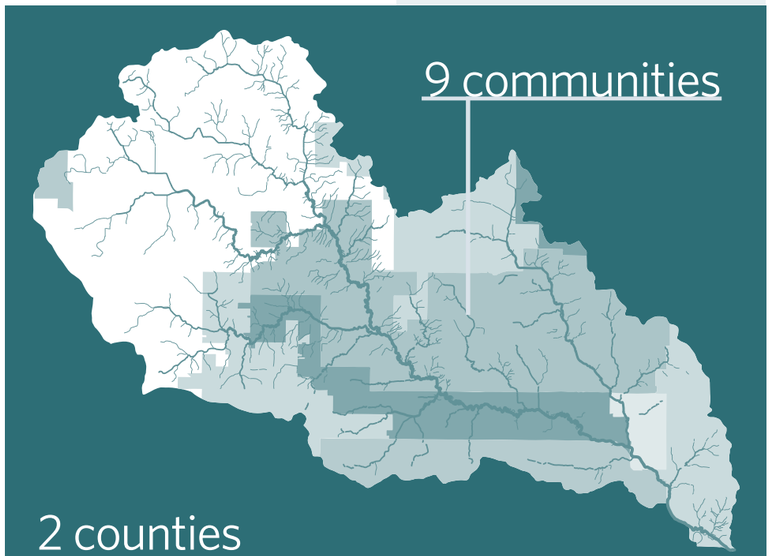
ISSUED JUNE 2016

For more information, view the complete master plan at www.walnutcreekwatershed.org

About the Watershed

53,000 acres
(83 square miles)

43% urban



430 acres/yr converting from urban to rural

Restoring healthy soils within open spaces after development could reduce runoff by **50%** or more during small storms (where applied)

Vision

Engaged residents working across political/property boundaries to create and sustain a healthy watershed.

Mission

Through collaboration, education and research, implement science-based policies and practices for:

1) Flood mitigation
2) Water quality improvements
3) Natural resources protection and
4) Improved recreation

while maintaining economic health.

Storms less than 2.5" make up 98% of Central Iowa's precipitation

During a 1-year storm (2.67" of rain), runoff rates in small urban streams may exceed levels caused by a 100-year storm (7.12" of rain) under natural conditions (prairie)

Case Studies

Rural

6.5 square miles

80% row crop farmland

Recommend reduction of: Nitrates by 41%, Phosphorus by 29%

Urban

4.5 square miles

Average *e.coli* bacteria monitored at levels **13x - 39x** the state of Iowa's water quality standard

0.1% of the watershed consists of construction sites contributing as much as **25%** of the sediment load

Challenges

Unstable Streams Dominate Watershed:

37% streamflow increase (since 1982)

57% of all field assessed streams have moderate or severe erosion

Upstream (Rural)
Higher Nitrogen and Phosphorus

Downstream (Urban)
Higher Bacteria and Construction Site Sediment

Landscape Change:

- Fast-moving Water
- Flood Zones Expanding
- Eroding Streams

ONLY **1%** of urban streams are "stable"

Lack of Topsoil Re-spread Increases:

80% small storm run-off

30% large storm run-off
